

disposing a first computer of a user on a network,
connecting an input device to the first computer to provide a user interface to the first computer, wherein the input device can sense positional data and optical indicia of the product, the from displayed indicia containing a product ID, and the input device has positional sensing capabilities and can scan optical indicia;

accessing a second computer disposed on the network in response to the user sensing the indicia of the product with the input device;

performing a lookup operation at the second computer to match the product ID with routing information of ~~a each of a plurality of~~ vendor servers disposed on the network, the vendor servers having ~~the unique product-related~~ information of the product;

returning the routing information of the vendor servers from the second computer to the first computer in order to access the vendor servers; and

accessing the vendor servers in accordance with the routing information to return the product-related information to the first computer for simultaneous presentation to the user.

2. (Currently amended) The method of Claim 1, wherein the step of accessing the vendor servers includes respectively accessing a distributor node of the input device, an advertiser node, and an E-commerce node.

3. (Original) The method of Claim 1, wherein the input device can sense information stored in magnetic medium.

4. (Currently amended) The method of Claim 1, wherein the step of accessing the vendor server further comprises the steps of,

returning the product information of the product respectively from an advertiser node, distributor information of a distributor of the input device from a distributor node, and E-commerce information from an E-commerce node, and

E-commerce information in a browser window of the first computer for presentation to the user.

Sub B

5. (Currently Amended) The method of Claim 1, wherein in response to receiving scanned indicia and positional data from the input device, a software interface running on the first computer converts the received indicia data and generates the routing information for transmission to the second computer.

X2

6. (Original) The method of Claim 1, wherein the routing information includes an input device ID and a network address of the second computer.

Sub B

7. (Original) The method of Claim 1, wherein the user enables reading of the indicia, in the step of connecting, by first depressing one or more buttons on the input device.

Sub B

8. (Currently Amended) The method of Claim 1, wherein a software interface running on the first computer is operable to automatically detect reading of the product indicia by the input device and detect positional data.

Sub B

9. (Original) The method of Claim 1, wherein the input device and a software interface running on the first computer perform a handshake operation using a unique input device ID stored in the input device prior to enabling operation of one or more operating modes of the input device.

Sub B

10. (Currently Amended) An architecture for obtaining product-related information of a product, comprising:

a first computer of a user disposed on a network,
an input device connected to said first computer to provide a user

the network of the a second location, while operating a first program on the user computer which utilizes the positional capabilities of the pointing device;

running a second program in the user's computer;
detecting with the second program the scanning of the encoded optical code;

connecting the first location to each of a plurality of the second locations over the network through a respective routing locations indicated by the information encoded in encoded optical codes in response to the step of detecting the encoded optical code; and

receiving information from each of the second locations transmitted therefrom to the first location for simultaneous display thereof.

20. (Original) The method of Claim 19, wherein the encoded optical code is a barcode.

21. (Original) The method of Claim 19, wherein the encoded optical code is an ISBN code.

22. (Original) The method of Claim 19, wherein the encoded optical code is an EAN code.

23. (Original) The method of Claim 19, wherein the encoded optical code is disposed on a flat surface.

24. (Original) The method of Claim 19, wherein the encoded optical code is disposed on a product.

25. (Original) The method of Claim 19, wherein the encoded optical code is encoded with information regarding the product and associated with a product.

26. (Original) The method of Claim 19, wherein the step of receiving information comprises displaying the information received from the second location when received therefrom.

27. (Original) The method of Claim 19, wherein the step of connecting includes the step of watching a web browser program which is operable to interface with the network.

28. (Currently Amended) The method of Claim 19, wherein the step of connecting comprises:

assembling a packet of data with the information extracted from the encoded optical code contained therein;

transferring the assembled packet to an intermediate network location remote from the first location;

providing at the intermediate location a database having contained therein a plurality of routing addresses on the network and corresponding encoded optical information;

comparing the information disposed in the received packet at the intermediate location with information in the database to determine if there is a at least one corresponding routing address disposed therein corresponding with the encoded optical information;

if a match exists, then returning the matching information in the form of the routing address to the first location; and

connecting the first location to each of a plurality of the second locations in accordance with the network address information returned thereto from the intermediate location.
